

Overview

This standard is about selecting, configuring and using digital devices, including PC, laptop, tablet or smart phones. This includes implementing and configuring operating systems, internet connections, application software, data storage media and peripheral devices such as printers and scanners.

Configuring and using digital devices involves setting up a PC, laptop, tablet or smart phone and associated peripheral components (including keyboard, mouse, storage media and printers / scanners). It includes being aware of different storage media capacities and transfer rates. It also includes installing and configuring standard software including an operating system, browser, security software and standard office application software.

This standard is for those who need to undertake digital device configuration to meet their own needs or as part of their duties.

Performance criteria

You must be able to:

1. Connect interface components (including keyboard, mouse and screen) to a digital device using Universal Serial Bus (USB) or wireless connections to enable user interaction 2. Install, configure and test an operating system software download to control the device 3. Adjust the operating system user interface settings to meet user needs 4. Create directory and file structures to meet data storage and retrieval needs 5. Connect to an Internet Service Provider (ISP) through a router using Wi-Fi or cable connection to provide online services 6. Use standard internet performance tools to measure the quality of download and upload speeds 7. Connect and configure camera, speakers, printer and scanner components correctly 8. Connect and configure storage media to provide data backup solutions 9. Backup data to connected storage media in line with organisational procedures
